

IN THE ABSTRACT:

Please amend the Abstract of the Disclosure as follows.

Bicycle seat ~~consisting of~~ including two ~~from each other~~ separated support portions for supporting one of the bicycle rider's (upper femur) seat bone, ~~whereby~~ so that each support portion is supported by a joint bar, which is arranged perpendicular to the central plane of the bicycle. In order to make the bicycle seat comfortable and specifically facilitate the movement of the seat bones when the rider pedals, ~~it is suggested a combination including that~~ each of the support portions is fixable on the bar and ~~consists of~~ includes at least three layers (6, 7, 8) firmly connected to each other by ~~means of~~ meeting surfaces, the undermost layer (6) being stiff and is fixable on the bar (3) and ~~that~~ the next layer (7) is a cushion, which is elastic in all directions. A third layer (8) is placed on the cushion and is stiff in all direction in its plane. The thickness of the cushion (7) ~~is increasing~~ increases in the direction to its forward edge and the elasticity is such that the surface pressure from the rider's seat bone when the thighs are moving up and down is met by the elasticity without the elasticity being completely consumed.
